

Easy Think

PHASE 1: Introduction - Laziness and Expectations

VERBATIM STREAM:

- [on_screen_text] LAZY
- [spoken_transcript] Most people are lazy. Not in a bad way. Just in, this isn't worth my brain power kind of way.
- [on_screen_text] Not in a bad way
- [on_screen_text] this isn't worth my brain power
- [spoken_transcript] Attention spans are shorter than ever. So, users should be able to figure things out instantly.
- [on_screen_text] Bold & Powerful Heading
- [on_screen_text] A Short Sentence is also enough, It depends on your situation.
- [on_screen_text] Call to Action
- [on_screen_text] The Easiest Way to Build Websites
- [on_screen_text] Sajid
- [on_screen_text] 666K views 8 months ago
- [on_screen_text] Subscribe
- [on_screen_text] Subscription added
- [spoken_transcript] What's the most important action here? What this icon does? And where to find more info?
- [on_screen_text] Load fast
- [spoken_transcript] When people land on a site, they bring expectations.
- [on_screen_text] Where's the navigation
- [spoken_transcript] They expect to see some links.
- [on_screen_text] Actions/buttons
- [spoken_transcript] They expect buttons to look like buttons.
- [on_screen_text] Noice content
- [spoken_transcript] They expect text to be readable and icons to make sense.
- [on_screen_text] Liked
- [spoken_transcript] The moment you break that expectation. You force them to think, and that's the enemy.
- [on_screen_text] wtf bruh

PHASE 2: The Google Example

VERBATIM STREAM:

- [spoken_transcript] Google is probably the purest example of don't make me think.
- [on_screen_text] Google
- [spoken_transcript] You don't even see these other options. All you see is one search bar with options to search by text, voice or image.
- [on_screen_text] Speak now
- [on_screen_text] Search by voice

- [spoken_transcript] Two buttons. Search and I'm Feeling Lucky. And that's it.
- [on_screen_text] Google Search
- [on_screen_text] I'm Feeling Lucky
- [on_screen_text] I'm Feeling Doodley
- [on_screen_text] I'm Feeling Playful
- [on_screen_text] I'm Feeling Hungry
- [spoken_transcript] It's almost boring. But it's not boring. It's genius. Because everyone knows exactly what to do.
- [spoken_transcript] Whether you're a kid searching for superman costume.
- [on_screen_text] superman costume
- [spoken_transcript] A teenager looking for how to impress girls. Or a grandparent typing how to use facebook. You get it. There's no need for instructions, no learning curve, and no unnecessary effort.

TEACHABLES:

1. TYPE: example

VERBATIM: Google is probably the purest example of don't make me think. You don't even see these other options. All you see is one search bar with options to search by text, voice or image. Two buttons. Search and I'm Feeling Lucky. And that's it.

PHASE 3: The Google Maps Incident

VERBATIM STREAM:

- [on_screen_text] But I had an unusual incident with
- [spoken_transcript] But I had an unusual incident with Google Maps.
- [on_screen_text] HOLD ON. ALMOST THERE!
- [spoken_transcript] Maybe I am too stupid to drive, but here is what happened.
- [spoken_transcript] I was driving on a new route and following directions on Google Maps. The app says continue straight.
- [on_screen_text] Continue straight
- [on_screen_text] 0.2 mi
- [on_screen_text] 31 min
- [spoken_transcript] But the road splits ahead into two paths. A flyover going straight at a higher level. And a flat road running straight beside the flyover at ground level.
- [on_screen_text] Route 10
- [spoken_transcript] Now I am unsure whether to take the flyover and miss the exit. Or the flat road and end up on a different route.
- [on_screen_text] credit: Family guy(FOX)
- [spoken_transcript] Exit's coming up. Half a mile. You'd think I could find it. Yeah. Yeah I would. I would.
- [spoken_transcript] Here is an obvious and simple solution.
- [on_screen_text] Let's simplify
- [spoken_transcript] The app recognizes the split, and provides clear instructions. Instead of continue straight, it says something like. Take the flyover, or take the exit.

- [on_screen_text] Flyover
- [on_screen_text] Exit
- [on_screen_text] Take the flyover
- [on_screen_text] Take flyover
- [spoken_transcript] The map zooms in to clearly show the split, with a bold line indicating the correct path and greyed out lines for other roads.
- [on_screen_text] Take Exit
- [on_screen_text] Take exit

TEACHABLES:

1. TYPE: example

VERBATIM: The app recognizes the split, and provides clear instructions. Instead of continue straight, it says something like. Take the flyover, or take the exit. The map zooms in to clearly show the split, with a bold line indicating the correct path and greyed out lines for other roads.

PHASE 4: Simplicity and Patterns

VERBATIM STREAM:

- [on_screen_text] Simplicity
- [on_screen_text] Simplicity isn't about dumbing things down
- [spoken_transcript] Simplicity isn't about dumbing things down. It's about making things so obvious that users don't need to stop and think.
- [on_screen_text] No Left Turn
- [on_screen_text] Winding Road (there are 2 or more curves ahead)
- [on_screen_text] Added Lane
- [on_screen_text] Intersection Ahead
- [on_screen_text] Lane Ends
- [spoken_transcript] Every click. Every scroll. Every field. Should feel effortless.
- [spoken_transcript] If your user has to pause and ask. Where's the menu?
- [on_screen_text] Where's the menu?
- [spoken_transcript] Is this a button or just text?
- [on_screen_text] Is this a button?
- [spoken_transcript] What happens if I click this?
- [on_screen_text] What happens if I click this?
- [spoken_transcript] Then your design has already lost.
- [on_screen_text] wtf bruh
- [on_screen_text] randombarger.com
- [spoken_transcript] Our brain loves patterns. Navigation at the top or on the side.
- [spoken_transcript] Buttons look like buttons. Rectangles with text.
- [on_screen_text] Buy now
- [spoken_transcript] A magnifying glass means search.
- [on_screen_text] Search
- [spoken_transcript] A cart icon means checkout.

- [on_screen_text] Checkout
- [spoken_transcript] These patterns exist for a reason. They work.
- [on_screen_text] Save
- [spoken_transcript] When you stick to conventions, users feel comfortable. They know what to expect, so they don't have to think.
- [spoken_transcript] That's why when you install a new software. All the primary actions appear in the same place.
- [on_screen_text] Back
- [on_screen_text] Next
- [spoken_transcript] Or if you notice all the big and lengthy contracts ask you to sign at the same place across all pages.
- [on_screen_text] Install
- [on_screen_text] Sign here
- [on_screen_text] Familiar
- [on_screen_text] New
- [spoken_transcript] You might worry that sticking to standard design will make your work boring.
- [on_screen_text] Boring
- [spoken_transcript] But trust me. It's not boring. It's good design.
- [on_screen_text] Good
- [on_screen_text] Confusing
- [spoken_transcript] The goal isn't to reinvent the wheel. Just make it roll better.
- [on_screen_text] We already got the wheel
- [on_screen_text] Just make it roll faster

[on_screen_text]

- \$

[on_screen_text]

-
- [spoken_transcript] Confusion kills conversions. Whether you're designing a hero section. A sign up form. Or an entire app.
- [spoken_transcript] Constantly ask yourself. Is this immediately clear? Would a first time user understand what to do next? If there's any doubt, simplify.

TEACHABLES:

1. TYPE: definition
VERBATIM: Simplicity isn't about dumbing things down. It's about making things so obvious that users don't need to stop and think.

2. TYPE: rule

VERBATIM: Our brain loves patterns. Navigation at the top or on the side. Buttons look like buttons. Rectangles with text. A magnifying glass means search. A cart icon means checkout. These patterns exist for a reason. They work.

PHASE 5: Simplicity is Hard

VERBATIM STREAM:

- [on_screen_text] Simple = Easy
- [spoken_transcript] Here's the catch. Simple designs are harder to make.
- [on_screen_text] Simple ≠ Easy
- [spoken_transcript] A lot of people think that simple means easy or lazy.
- [on_screen_text] Simple ≠ Lazy
- [spoken_transcript] Oh you just added a grey background and a big button. That probably took 5 minutes.
- [on_screen_text] Here's why
- [on_screen_text] `div{ background: hsl(0, 0%, 20%); color: hsl(0, 20%, 100%); text-align: center; border-radius: 20px; padding: 2rem 4rem; }`
- [on_screen_text] `a{ display: inline-block; background: hsl(0, 0%, 100%); color: hsl(0, 20%, 0%); border-radius: 8px; padding: 1rem 2rem; margin-top: 2rem; text-decoration: none; }`
- [spoken_transcript] I wish. The truth is, simplicity takes work.
- [on_screen_text] Its not about "How"
- [on_screen_text] Its all about "Why"
- [spoken_transcript] It's much harder to create something clean and clear. Than it is to add a bunch of extra stuff.
- [spoken_transcript] Like look at the buttons placement in the software example. It's simple for you as a user.
- [on_screen_text] Back
- [on_screen_text] Next
- [spoken_transcript] But the developer went through some additional steps. Just to make sure the buttons are in the same place on all the pages. Across all screen sizes.
- [on_screen_text] Install
- [on_screen_text] Discipline
- [spoken_transcript] Simplicity requires discipline. Attention to detail. And a deep understanding of the user.
- [on_screen_text] Attention to detail
- [on_screen_text] DEEP understanding
- [spoken_transcript] It's not about what you add. It's about what you leave out.
- [on_screen_text] Simple
- [on_screen_text] Detailed
- [spoken_transcript] Figuring out what to remove. While still delivering everything the user needs. Is incredibly challenging.
- [on_screen_text] Visually : Bad
- [on_screen_text] Useful : No

- [on_screen_text] Friendly: Yes
- [on_screen_text] Visually : Okayish
- [on_screen_text] Useful : Good enough
- [on_screen_text] Friendly: Okayish
- [on_screen_text] Visually : Good
- [on_screen_text] Useful : Kinda...
- [on_screen_text] Friendly: Yes
- [spoken_transcript] It forces you to think, test and iterate constantly.
- [on_screen_text] It's a game of balance
- [spoken_transcript] Simple designs might look effortless. But behind the scenes. They are the result of countless decisions made with precision and purpose.
- [on_screen_text] It's a game of precision
- [spoken_transcript] That's why simplicity isn't just a design choice. It's a skill. And it's one of the hardest to master.
- [on_screen_text] It's a hard game

PHASE 6: Simple vs Minimal

VERBATIM STREAM:

- [spoken_transcript] An important distinction. Simple doesn't mean minimal to the point of being useless.
- [on_screen_text] Simple ≠ minimal
- [on_screen_text] Simple to use
- [on_screen_text] minimal to look at
- [spoken_transcript] If a design is simple or minimal, but lacks essential elements. It's bad design.
- [spoken_transcript] A lot of times you need to pack a lot of elements together. So the users can make an informed decision.
- [on_screen_text] Ex: Dashboards
- [on_screen_text] Ex: SaaS Apps
- [on_screen_text] Buy now
- [spoken_transcript] But do you really need 3 different buttons? Or could a single, clear button be more effective?
- [spoken_transcript] Does that fancy animation add value? Or is it just a distraction?
- [on_screen_text] Every unnecessary thing you remove makes your design clearer and easier to use
- [spoken_transcript] Every unnecessary thing you remove makes your design clearer and easier to use.
- [spoken_transcript] Also. Please make your text easy to scan.
- [on_screen_text] NOBODY READS WALLS OF TEXT NOBODY READS WALLS OF TEXT NOBODY READS WALLS OF TEXT
- [on_screen_text] Wall of Text
- [on_screen_text] Welcome to our company. We specialize in high-quality furniture crafted with premium materials to ensure durability, comfort, and style across a wide range of home and office environments.

- [spoken_transcript] Use headings and bullet points for key information. Create visual hierarchies that guide the eye.
- [on_screen_text] Scannable
- [on_screen_text] Furniture That Transforms Spaces
- [on_screen_text] Premium quality
- [on_screen_text] Designed for comfort
- [on_screen_text] Style meets durability
- [on_screen_text] Perfect for home & office
- [on_screen_text] Which one is better?
- [on_screen_text] Expectation
- [on_screen_text] Logo
- [on_screen_text] Option
- [on_screen_text] Category
- [on_screen_text] Links
- [spoken_transcript] People aren't going to analyze the whole UI. And click on the perfect option.
- [on_screen_text] Reality
- [spoken_transcript] They will quickly scan the page and click the first reasonable or obvious option.
- [spoken_transcript] And if the solution didn't work out. They will go back and try again.
- [on_screen_text] But it's not
- [on_screen_text] Good enough
- [spoken_transcript] Your job is to make the perfect option the most obvious solution. So they don't have to go back that often.
- [on_screen_text] & the cycle continues....

TEACHABLES:

1. TYPE: rule
VERBATIM: Simple doesn't mean minimal to the point of being useless. If a design is simple or minimal, but lacks essential elements. It's bad design.
2. TYPE: rule
VERBATIM: Please make your text easy to scan. Use headings and bullet points for key information. Create visual hierarchies that guide the eye.

PHASE 7: The "Shooz" Store Example - User Flow

VERBATIM STREAM:

- [on_screen_text] Let's call it "SHOOZ"
- [spoken_transcript] Say you are building an online shoe store.
- [on_screen_text] SHOOZ
- [spoken_transcript] You got tough hiking shoes for men.
- [on_screen_text] Men's Trekking Titans
- [spoken_transcript] Cute and fancy ones for the ladies.
- [on_screen_text] Kids' Party Princess

- [spoken_transcript] And everything in between. From sports to casual to formal. You got them all.
- [on_screen_text] Leather Mavericks
- [on_screen_text] Everyday Sneakers
- [on_screen_text] Chic Sandals
- [on_screen_text] Oxford Classics
- [on_screen_text] Loafers Luxe
- [on_screen_text] Sprint Runners
- [on_screen_text] Street Sneakers
- [on_screen_text] Glam Stilettos
- [on_screen_text] Trendy Trainers
- [on_screen_text] Active Runners
- [on_screen_text] Fancy Flats
- [on_screen_text] Kids' Cozy Boots
- [spoken_transcript] That means you got a lot of products and a limited space to show them all.
- [spoken_transcript] That means the users have to click multiple times to get to their preferred option.
- [on_screen_text] Enter
- [on_screen_text] Option
- [on_screen_text] Street Sneakers
- [spoken_transcript] In order for the new users to complete their purchase. We need to make those clicks obvious and effortless.
- [spoken_transcript] That's where. A user flow diagram comes in.
- [on_screen_text] User flow diagram
- [on_screen_text] aka user's journey
- [spoken_transcript] It guides the user on the shortest and simplest path to complete their objective.
- [spoken_transcript] Let's create a fictional user to map out their journey.
- [on_screen_text] User
- [on_screen_text] David - 24
- [spoken_transcript] David. Age 24 is looking for a black pair of oxford shoes for his upcoming job interview.
- [on_screen_text] Objective
- [on_screen_text] Buy - black oxfords
- [spoken_transcript] So he enters our website and sees 3 options.
- [on_screen_text] Home
- [on_screen_text] Men
- [on_screen_text] Women
- [on_screen_text] Kids
- [spoken_transcript] Then 4 more options.
- [on_screen_text] Formal
- [on_screen_text] Casual
- [on_screen_text] Sports

- [on_screen_text] Outdoor
- [spoken_transcript] 5 more options.
- [on_screen_text] Oxford
- [on_screen_text] Derby
- [on_screen_text] Brogues
- [on_screen_text] Monk Strap
- [on_screen_text] Loafers
- [spoken_transcript] And then maybe 6 or 60 more options depending on your catalog.
- [on_screen_text] Shoe
- [spoken_transcript] This is where most of the thinking will happen.
- [spoken_transcript] But we want David to have an amazing user experience. So we got sorting options and some filters as well.
- [on_screen_text] Sort
- [on_screen_text] Popular
- [on_screen_text] Trending
- [on_screen_text] Most rated
- [on_screen_text] Latest
- [on_screen_text] Filters
- [on_screen_text] Size
- [on_screen_text] Color
- [on_screen_text] Material
- [on_screen_text] Style
- [on_screen_text] Fit/Shape
- [on_screen_text] Brand
- [on_screen_text] Price Range
- [on_screen_text] Occasion/Purpose
- [on_screen_text] Comfort Features
- [on_screen_text] Sole Type
- [on_screen_text] Construction Method
- [on_screen_text] Heel Type/Height
- [spoken_transcript] After some thinking and filtering. David got the shoe he wanted.
- [on_screen_text] Buy now
- [on_screen_text] Add to cart
- [spoken_transcript] The website didn't force him to log in. He can fill the shipping address and pay, however he wants.
- [on_screen_text] Address
- [on_screen_text] Log in
- [on_screen_text] Payment
- [on_screen_text] Success
- [spoken_transcript] This took some clicks. But we didn't make him think.
- [spoken_transcript] However. Some users don't like to go that deep. So. You need to have a search bar that could eliminate clicks and take them directly to what they are looking for.
- [on_screen_text] Black Leather Wholecut Oxford Shoes for Men - Size 8

- [spoken_transcript] Now that you got a simple user flow. It's time to design.

TEACHABLES:

1. TYPE: definition

VERBATIM: User flow diagram aka user's journey. It guides the user on the shortest and simplest path to complete their objective.

PHASE 8: Designing the "Shooz" Interface

VERBATIM STREAM:

- [spoken_transcript] Let's start with the main header. Logo on the top left. Then those primary links and the search bar. And lastly the login button for returning customers.
- [on_screen_text] SHOOZ
- [on_screen_text] MEN
- [on_screen_text] WOMEN
- [on_screen_text] KIDS
- [on_screen_text] Try searching "formal shoes for men"
- [on_screen_text] Log in
- [spoken_transcript] Now to reach here. David will click on Men.
- [spoken_transcript] According to our user flow we can show the 4 main categories like a drop down menu.
- [spoken_transcript] But our job is to make the process of getting here much easier.
- [spoken_transcript] So. Let's get rid of this additional layer of complexity. And provide a simpler solution.
- [spoken_transcript] This way. David can get to the shoes catalog. In just two simple and obvious clicks.
- [on_screen_text] Oxford Shoes for Men
- [on_screen_text] 264 items
- [spoken_transcript] As we discussed earlier. This is where most of the thinking will happen. So. We can't bombard the user with information.
- [spoken_transcript] Just a big and beautiful product image with clean and clear typography.
- [on_screen_text] Allen Edmonds
- [on_screen_text] Plain Toe Oxford
- [on_screen_text] \$110.00
- [on_screen_text] Shoe 2
- [on_screen_text] Johnston & Murphy
- [on_screen_text] Cap Toe Oxford
- [on_screen_text] \$90.00
- [on_screen_text] Shoe 3
- [on_screen_text] Cole Haan
- [on_screen_text] Wingtip Oxford
- [on_screen_text] \$160.00
- [on_screen_text] Shoe 4

- [on_screen_text] Alden
- [on_screen_text] Cap Toe Oxford
- [on_screen_text] \$70.00
- [on_screen_text] Shoe 5
- [on_screen_text] Florsheim
- [on_screen_text] Wholecut Oxford
- [on_screen_text] \$90.00
- [on_screen_text] Shoe 6
- [on_screen_text] Shoe 7
- [on_screen_text] Shoe 8
- [spoken_transcript] David can look at all the products. Their ratings. The brand and styles. And lastly. The most important detail. Price.
- [on_screen_text] 4 ★ | 503
- [spoken_transcript] But we got a lot of options here. That means a lot of thinking. So let's help David by adding filters and sorting options as well.
- [spoken_transcript] I think the page is quite scannable now. It's easy to find a perfect option without a lot of thinking or going back and forth on the website.
- [on_screen_text] Alright
- [on_screen_text] we are almost there
- [spoken_transcript] Alright. We are almost there. Just a few more clicks and a bit of thinking to complete this journey.
- [spoken_transcript] But first we need to design the most critical page of this website. The page with these two buttons.
- [on_screen_text] Product Page
- [spoken_transcript] You see. David will have some basic expectations here.
- [spoken_transcript] He would want to see images. Reviews. Color variations. A size picker. Delivery time and product details.
- [on_screen_text] Images
- [on_screen_text] Reviews
- [on_screen_text] Color variations
- [on_screen_text] Size picker
- [on_screen_text] Delivery time
- [on_screen_text] Product details
- [spoken_transcript] So. Let's make all of this very easy to find and understand.
- [spoken_transcript] First of all. Some photos in a carousel format to avoid unnecessary scrolling.
- [spoken_transcript] Next. The most important information. Product name and pricing.
- [spoken_transcript] Let's style it better to add some hierarchy. And add the ratings with the underline to tell it's clickable.
- [on_screen_text] 503 Ratings
- [spoken_transcript] Then color variations and size selector to find a perfect match.
- [on_screen_text] Color: Black
- [on_screen_text] Select your Size
- [on_screen_text] Size chart

- [on_screen_text] 6
- [on_screen_text] 6.5
- [on_screen_text] 7
- [on_screen_text] 7.5
- [on_screen_text] 8
- [on_screen_text] 8.5
- [on_screen_text] 9
- [spoken_transcript] We can automatically get David's zip code. And let him know about the delivery.
- [on_screen_text] Deliver to
- [on_screen_text] Los Angeles 90001
- [on_screen_text] Get it by Mon, Jan 06
- [on_screen_text] Please enter your ZIP code to check delivery time & Availability
- [spoken_transcript] Notice that we have underlined the clickable text. It's these little details that matter.
- [spoken_transcript] Talking of details. I don't want to add product details here. Delivery details and buy now. Belong together. And product details aren't gonna fit here anyway.
- [spoken_transcript] So. Let's compromise and add the buttons instead.
- [on_screen_text] Buy now
- [on_screen_text] Add to cart
- [spoken_transcript] But these buttons are competing for attention. So let's add some hierarchy by using a color.
- [spoken_transcript] Now we can add the product details. Without making the design too complicated. Or distracting from the key actions.
- [on_screen_text] Product Details
- [spoken_transcript] I don't think this will be considered a minimal design. We are showing all the essential elements to make an informed decision. But at the same time. It's scannable and don't force you to think.

TEACHABLES:

1. TYPE: demo
 VERBATIM: Let's start with the main header. Logo on the top left. Then those primary links and the search bar. And lastly the login button for returning customers. Now to reach here. David will click on Men. According to our user flow we can show the 4 main categories like a drop down menu. But our job is to make the process of getting here much easier. So. Let's get rid of this additional layer of complexity. And provide a simpler solution. This way. David can get to the shoes catalog. In just two simple and obvious clicks.
2. TYPE: demo
 VERBATIM: First of all. Some photos in a carousel format to avoid unnecessary scrolling. Next. The most important information. Product name and pricing. Let's style it better to add some hierarchy. And add the ratings with the underline to tell it's clickable. Then color variations and size selector to find a perfect match. We can automatically get David's zip code. And let him know about the delivery. Notice that we have underlined

the clickable text. It's these little details that matter. Talking of details. I don't want to add product details here. Delivery details and buy now. Belong together. And product details aren't gonna fit here anyway. So. Let's compromise and add the buttons instead. But these buttons are competing for attention. So let's add some hierarchy by using a color. Now we can add the product details. Without making the design too complicated. Or distracting from the key actions.

PHASE 9: Convincing Stakeholders & Usability Testing

VERBATIM STREAM:

- [on_screen_text] How to
- [on_screen_text] How to convince
- [on_screen_text] How to convince your boss
- [spoken_transcript] Now a very important question. How to convince your boss or client on these decisions.
- [on_screen_text] How to convince your designer
- [on_screen_text] How to convince your developer
- [on_screen_text] How to convince your manager
- [on_screen_text] How to convince your mum
- [on_screen_text] to
- [on_screen_text] approve
- [on_screen_text] these
- [spoken_transcript] Or sometimes we get stuck with a bad designer. Incompetent dev. Or a project manager who are too stupid or rigid to get on board.
- [spoken_transcript] Here is a solution. Get them to watch a usability test.
- [on_screen_text] do
- [on_screen_text] Usability test
- [spoken_transcript] What is a usability test? Basically. Get a target user to use your app for the first time. And ask them to do something specific.
- [on_screen_text] User
- [on_screen_text] You
- [on_screen_text] Hi
- [on_screen_text] Can you try my app
- [on_screen_text] No
- [on_screen_text] Please
- [on_screen_text] Pretty please
- [on_screen_text] Ok
- [on_screen_text] Please try to find black oxfords for Men
- [spoken_transcript] Then ask them to do the same thing on your competition.
- [on_screen_text] Can you try another app
- [on_screen_text] bruh...
- [spoken_transcript] If they are performing better on other apps. Why would they use yours?
- [spoken_transcript] And if they won't use your app. You won't make money. Your boss will understand that too. No matter how rigid they are.

- [on_screen_text] Hey bossman, what do you think?
- [on_screen_text] Yeah yeah, I see your point
- [spoken_transcript] Now bring out the prototype you have designed. And test it with the same user.
- [on_screen_text] Bro, one last test.
- [on_screen_text] I promise
- [on_screen_text] No
- [on_screen_text] I will pay this time
- [on_screen_text] Cool
- [on_screen_text] a few clicks later
- [spoken_transcript] If the new design is performing better than the competition. It will get implemented.
- [on_screen_text] Approved
- [spoken_transcript] Everything follows money.

TEACHABLES:

1. TYPE: procedure

VERBATIM: Get them to watch a usability test. What is a usability test? Basically. Get a target user to use your app for the first time. And ask them to do something specific.

Then ask them to do the same thing on your competition. If they are performing better on other apps. Why would they use yours? And if they won't use your app. You won't make money. Your boss will understand that too. No matter how rigid they are. Now bring out the prototype you have designed. And test it with the same user. If the new design is performing better than the competition. It will get implemented.
